

An aerial photograph of a city street intersection. A prominent white and red striped crosswalk is visible. Several pedestrians are walking across the street, including a person in a pink shirt, a person in a white jacket, and a person in a blue shirt. The street is paved with asphalt and shows some wear and tear.

# TECHNOLOGY TO ACCELERATE SUSTAINABLE DEVELOPMENT GOALS

**Currently, in the world there is an approximate population of 7300 million people, and for the 2050 there is an estimation that we will be 9700 million. According to the Sustainable Development Goals of the United Nations, more than half of the world's population lives in urban areas, and they estimate that by the year 2050 that number will have increased to 6.5 billion people.**

**The speed of growth of cities in the world, with set of migrations of rural communities in the city, has been an explosive effect of urban areas.**

The main problem is the extreme poverty that tends to be concentrated in urban spaces. Improving the safety and sustainability of cities means ensuring access to safe and affordable housing and improving green public settlements and improving urban planning and management in a participatory and inclusive manner.
